

OpenGraph Lite Viewer - English help notes v4503

Dutch sample sentences remain unchanged. Interface and help/documentation text are maintained in English on request.

Tree first

Tree first is the didactic and notational sequence in OpenGraph/JAN. The central open tree is the source. Projections are then drawn to the axes: LEX west, SYNTAX east, and LOG/FT south.

- LEX: surface order, placement rules, traces, exchanges, and insertion boxes.
- SYNTAX: syntactic rules projected at the source-node height.
- LOG/FT: logical or functional order below the tree.

LEX exchanges and insertions remain on the LEX axis; they are not inserted as extra central tree nodes.

Recursion technique in the tree

Recursion is the technical drawing method. The viewer builds the layout bottom-up: leaves first, then category nodes, subtrees, boxes, and finally the complete tree. This is separate from the didactic choice called tree first.

Config screen changes

- The Config top bar is sticky: Back to main remains visible while the settings page scrolls.
- The old Redesign - tree first block has been moved from Config to Help/documentation.
- Menus above grid is visible again in Config and includes Main window, so fit/scroll and tree spacing can be placed above the main grid.

Terminology note

Use the project spelling carrousel. The folder carrousel/ can run as a standalone module and can also be returned through ChatGPT for reintegration into the project zip.
