

OpenGraph Lite Viewer - English documentation v4506

This is the maintained English documentation track for the OpenGraph Lite Viewer. Dutch linguistic examples remain unchanged because they are the test data. Interface language, help texts, config labels, render comments, the carousel module and documentation are maintained alongside the Dutch version.

Main concepts

OpenGraph/JAN uses free nodes and branches on a grid. The central tree is not forced into a traditional gravity-like tree direction. Independent projection axes can be drawn around the same source: LEX at the west side, SYNTAX at the east side, and LOG/FT at the south side.

Tree first versus recursion

Tree first is a notation and teaching order: first show the central source tree, then show the projections. Recursive box layout is the technical drawing method: leaves are measured first, then categories and subtrees are combined bottom-up. These two notions must not be confused.

LEX rendering

The LEX axis is a separate render layer. Lexical material is first projected to base positions. Local movement rules may then fill free slots, and the old base position can be shown as a trace. The central tree itself is not rewritten by these LEX movements.

OSV-! warning

OSV-! is deliberately marked with an exclamation mark. The box approach can never produce OSV as a base alternative, because VP still groups object and verb as a subtree. To render the visible LEX axis correctly, an explicit movement rule is always required. OSV-! is not a base layout or linguistic alternative.

Carrousel

The explanatory image module is named carrousel. It lives in its own carrousel/ folder and can be extracted from the project zip as a self-contained module. The spelling carrousel is used deliberately.

LEX adverb insertion slots

Adverb placement is not one uniform operation. The base rule is: reserve slots between visible LEX boxes; when two relevant boxes vertically overlap, place the slot on the overlap; then choose the exact domain by scope.

Adverbs	Type	Preferred placement
VANDAAG, GISTEREN, MORGEN	time	VP-BETWEEN or S-LEFT when fronted
VAAK, SOMS, ALTIJD	frequency	VP-BETWEEN
NIET	negation	separate NEG / V-NEAR slot
SNEL, HARD, ZACHTJES	manner	V-NEAR or VP-RIGHT
MISSCHIEN, WAARSCHIJNLIJK, HELAAS	sentence adverb	high S/VP or S-LEFT
ALLEEN, OOK, ZELFS	focus	beside the focused phrase
HEEL, ERG, ZEER	degree	AP/AdvP/NP-internal

Implementation rule

Create free LEX slots between LEX boxes; place a slot on vertical overlap when possible; choose a preferred domain per adverb type; add the adverb as an external LEX insertion or phrase-internal insertion; do not rewrite the central tree.

Current Dutch test sentences

HOND BIJT MAN; VROUW HEEFT TRUI GEBREID; OMDAT HOND MAN BIJT; HOND BIJT VANDAAG MAN. These examples remain Dutch in the English interface.
